PROFILE

I am an Industrial Product Designer with over 6 years of CAD experience and a strong foundation in mechanism application, rapid prototyping, and human-centered problem solving. I specialize in designing functional, manufacturable systems that balance usability, safety, and aesthetic clarity. I am driven by solving real-world problems that improve everyday experiences — particularly for individuals facing mobility limitations, strength challenges, or spatial constraints. My goal is to design products that are not only mechanically sound, but meaningfully improve how people interact with their environment.

PORTFOLIO PROJECTS

ERGONOMIC FOLDING CHAIR FOR HEALTHCARE ENVIRONMENTS (16-WEEK PROJECT)

Developed a folding chair solution addressing limited space, temporary seating demands, and hygiene requirements in hospital patient rooms over a 16-week design cycle. Working in a team of four, we generated 12 concepts to explore structural direction, folding strategies, and ergonomic form before refining a simplified linkage system in Fusion 360. Through reverse-engineering existing chairs, I redesigned the mechanism to reduce mechanical complexity while improving stability and visual clarity. Unlike conventional folding chairs with bulky cross-bracing, the final design features a compact folding geometry that collapses efficiently for storage while maintaining rigidity when deployed. The outcome enhances spatial flexibility in clinical settings by enabling fast, hygienic, and space-efficient seating without compromising durability or safety.

TWIZEL TUBES – SUSTAINABILITY-INSPIRED EDUCATIONAL PLAY SYSTEM (16 WEEK PROJECT)

Developed an interactive play system for children aged 5–13 that translates Twizel's hydroelectric history into a hands-on learning experience. The design centres on a rotating 4x4 sliding pipe puzzle embedded within a mountain-inspired structure, where users align pipe segments around obstacles before releasing water to power a visible turbine. The simplified grid ensures accessibility for younger children while maintaining replayability through a full-structure rotation reset mechanism. By transforming regional infrastructure into a tactile, collaborative challenge, the installation promotes problem-solving, environmental awareness, and local identity within a compact and engaging public play format.

WORKING EXPERIENCE

KITCHEN HAND

KATSUBI · On site | 2025 - 2026

- Maintained operational efficiency in high-pressure environments, strengthening time management and workflow optimization skills
- Ensured strict hygiene compliance, reinforcing attention to detail and quality control
- Coordinated with team members during peak service, developing communication and collaborative problem-solving skills

27 Steps · On site | 2021 - 2022

- Assisted in fast-paced food preparation, improving adaptability and task prioritization
- Followed standardized procedures consistently, reinforcing structured process thinking

Taso's takeaway · On site | 2020 - 2021

- Managed POS systems and customer interaction, improving user-focused communication
- Maintained consistency and quality control under high volume demand

EDUCATION

BACHELOR OF INDUSTRIAL PRODUCT DESIGN

University of Canterbury

Class of 2026

BURNSIDE HIGHSCHOOL

class of 2023

PORTFOLIO PROJECTS

RECYCLED EVA/HDPE SHIN GUARD SYSTEM (16 WEEKS)

Developed a sustainable shin guard by re-engineering post-consumer EVA footwear and recycled HDPE bottle caps into a durable, impact-resistant sports product. Produced 8 functional prototypes, testing heat fusion variables, compression force, material density, and bonding methods to refine structural integrity and cushioning performance. Established a repeatable fabrication workflow using controlled heat pressing, hydraulic compression to 6mm thickness, laser cutting, and layered bonding to combine flexible shock absorption with a rigid protective shell. Designed for the large youth and amateur sports market, the system leverages widely available waste streams to reduce material cost and landfill impact while maintaining protective performance comparable to conventional plastic shin guards.

BOTTOMSUP: INCLUSIVE WATER DISPENSING SYSTEM (16-WEEK PROJECT)

Designed BottomsUp to address the difficulty many older adults and individuals with arthritis face when lifting heavy kettles or boilers. Through observation and informal user testing with peers and family members, I identified wrist strength and mobility limitations as a key contributor to spill and burn risk. Inspired by bottom-filling beverage systems, I researched fluid control, sealing mechanisms, and heating integration to adapt a similar approach for domestic water dispensing. Developed through multiple CAD iterations, the final concept eliminates lifting entirely by delivering controlled bottom-up filling through a sealed release system, improving stability and safety. The project demonstrates user-centred mechanical thinking by translating a common household pain point into a practical, accessibility-focused engineering solution.

LANGUAGES

- **English (fluent)**
- **Cantonese (native)**
- **Mandarin (advanced)**

PERSONAL ACCOMPLISHMENTS

- **Strength Training & Performance Coaching (5x Weekly Discipline)** – Maintain a structured evidence-based training routine with strong knowledge of anatomy, biomechanics, supplementation, and progressive overload. Have coached 10+ individuals, improving lifting technique, movement efficiency, and measurable strength outcomes through personalised programming and technical guidance.
- **Radiant Rank** – Valorant (Top 500 Oceania, Peak #405) – Achieved the highest competitive rank within a global system after 4 years of consistent improvement, demonstrating elite-level strategic thinking, adaptability, and high-pressure team coordination.
- **Division 1 Basketball (10+ Years Competitive Experience)** – Competed at high level for over 6 years; served as Senior Team Captain, developing leadership, discipline, resilience, and structured team communication.
- **Custom PC Systems & Hardware Optimisation (5+ Builds)** – Built and configured multiple high-performance PC systems, advising on components and optimising performance, compatibility, and long-term reliability.
